WORK EXPERIENCE

Shelde

Senior Consultant

Feb. 2019– Present

Melbourne, Australia

- Developed and maintained Silverfort's first AWS implementation as a C1 application, integrating over 400 domain controllers into a single platform. This enabled granular ring fencing and custom rules for privileged account access across an entire bank. Led a team of 4 BAU engineers providing operational support and incident response.
 - Wrote C# services responsible for high throughput authentication log processing (200 MB/s), telemetry polling for infrastructure monitoring and backup generation.
 - Developed an IaC Terraform solution for multi-environment and multi-region promotion.
 - Designed and validated the platform's disaster recovery workflow with an RTO of 4 hours.
 - Led implementation of Splunk monitoring with automated alerting (CPU > 65%, HDD > 70%, RAM > 70%) for incident detection. Maintained 100% uptime over 9 months of production operation.
 - Created the solution design compliant with regulatory standards for the finance sector (APRA CPS 234).
 - **Stack:** C#, Python, AWS, Terraform, Codefresh, Linux (RHEL).
- Implemented the Code DX static analysis platform on AWS EKS with an RDS database solution, enabling automated vulnerability scanning of internal applications. The tool was integrated into over 80 application CI/CD pipelines within six months of production deployment. Led a team with two junior engineers for the build.
 - Wrote Golang REST API services with Azure AD authentication enabling configuration updates without restarts, real-time notifications and logging.
 - Built Codefresh CI/CD pipelines with GitOps workflows and multi-environment promotion.
 - Integrated the solution with Istio for service discovery and Splunk for platform monitoring.
 - **Stack:** Golang, Docker, AWS, Codefresh, Kubernetes, Helm, Terraform.
- Migrated a cluster of .NET services from a legacy on-prem solution to a cloud native one. Designed and built the CI/CD infrastructure on Github Enterprise with Vault secret management integration. Pipeline run times improved from 5-20 minutes to < 2 minutes for most applications.
 - Refactored existing C# applications for compatibility with the new CI/CD platform and Vault.
 - Developed GitHub Actions workflows for automated testing, security scanning and code reviews.
 - Integrated AI (GitHub Copilot) into developer workflows for automated code comments on pull requests and improved bug detection.
 - **Stack:** .NET, C#, GitHub Enterprise, Ansible, Openshift, Vault.
- Rebuilt a failing CyberArk AWS Deployment that was not compliant with its C1 SLA. Developed and implemented a blue/green deployment strategy with automated failover to improve platform stability. The new build maintained an uptime of 99.99% over nine months with an RTO of one hour.
 - Reduced platform AWS costs by approximately 30% with instance scheduling and by optimizing instance sizing.
 - Developed Golang services to maintain compatibility with legacy systems - both service discovery and API translation.
 - Debugged and resolved critical infrastructure failures with load testing and logging. Implemented platform monitoring and observability with CloudWatch.
 - **Stack:** AWS, Terraform, Golang, Windows.

Deloitte

Oct. 2015 – Nov. 2018

Senior Consultant | Nov. 2017 - Nov. 2018

Melbourne, Australia

- Developed a central big data warehouse alongside a large development team which facilitated machine learning model development inside a large telecommunications company. The Spark/Hadoop platform ingested 20-100 TB per day with up to 12 months retention for model training and near real-time inference.
 - Refactored internal Java applications into supporting an event driven architecture by pushing logs to Kafka topics in real-time.
 - Developed ETL services in Scala to perform the relevant data processing. These services were automated with Jenkins for the build and execution across environments
 - **Stack:** Scala, Java, Spark, Jenkins.

Consultant | Nov. 2015 - Nov. 2017

Melbourne, Australia

- Designed and built a data visualization product for Deloitte Access Economics, which generated interactive dashboards estimating the impact of global events on the Australian economy. The product was used to improve client experience when navigating proprietary data.
 - Built Java services to ETL from public and private datasets into a central MySQL database.
 - Co-developed the user interface in Tableau with a UX designer.
 - Built the automation pipelines in Jenkins for automatically refreshing the data at fixed intervals. Also designed the workflows for promoting new features to the production application from staging.
 - **Stack:** Java, Tableau, Jenkins, MySQL.

Found Digital

Jul. 2014 – Sep. 2015

Engineer

Melbourne, Australia

- Developed an attribution modelling platform alongside a team of engineers. The system consolidated data produced by different marketing channels and correlated them to produce a comprehensive view of customer behaviour. The analytics and optimizations produced by this platform improved campaign CPAs (cost per acquisition) by between 12 to 80%.
 - Implemented data matching algorithms in python with fuzzy matching.
 - Built services in Java and Python for ETL and data processing to link data from multiple advertising platforms. This data was stored in a centralized AWS RDS MySQL database.
 - **Stack:** Java, Python, AWS.

EDUCATION

University of Technology, Sydney

2012

Bachelor of Business - Maj. Economics, Min. Computer Science, Finance

CERTIFICATIONS, SKILLS & INTERESTS

- **Programming Languages:** C#, Golang, Python.
- **Technologies:** AWS, .NET (7/8/9, ASP.NET), Kubernetes, Helm, JVM (17/21, Ktor), Terraform, Codefresh, GitHub Enterprise (Workflows & Actions), Ansible, Splunk, Linux (RHEL).
- **Skills:** Writing & documentation, solution design, networking, distributed systems, security.
- **Interests:** Cinema, programming challenges, visual arts, gardening, hiking, games.
- **Certifications:** HashiCorp - Terraform Associate, AWS - Certified Developer.
