PROFESSIONAL SUMMARY

Senior software and platform engineer with 10+ years of experience with a focus on security, automation and observability. I have led end-to-end delivery of secure, regulated platforms on AWS and Kubernetes, including high-throughput authentication systems, static analysis platforms, and cloud migrations that improved reliability, costs, and delivery speed.

I am now targeting roles where I can own critical services, shape technical standards, and mentor engineers..

STACK

Programming Languages: Golang, C#, Python.

Cloud & Infrastructure Tools: AWS, Kubernetes, OpenShift, Helm, Terraform, Codefresh, Ansible, Docker.

Other Technologies: .NET, GitHub Enterprise, Splunk, Datadog, Red Hat Enterprise Linux, PostgreSQL.

WORK EXPERIENCE

Shelde

Senior Consultant

Feb. 2019– Present

Melbourne, Australia

- Led development of a highly available authentication platform in AWS for one of Australia's major banks. Integrated all domain controllers into a single plane of glass that enabled granular ring-fencing and custom rules for privileged access. Managed a team of 4 BAU engineers for ongoing operations and incident response.
 - Designed and validated the platform's disaster recovery workflow with an RTO of 4 hours.
 - Maintained 100% uptime over 9 months of production operation.
 - Designed the solution compliant with regulatory standards for the finance sector (APRA CPS 234).
 - Participated in incident response on call - led post incident reviews with BAU engineers to improve both the platform itself and operational runbooks.
- Designed and implemented a static analysis microservices platform on AWS EKS to provide automated vulnerability scanning across internal applications, integrating the tool into 80+ CI/CD pipelines within six months and leading a team of two engineers from design through production.
 - Led API design for a static-analysis system, aligning requirements across engineering, security, and developer-experience teams.
 - Wrote Golang REST API services with Azure AD authentication enabling application onboarding, configuration updates without restarts, real-time notifications and logging.
 - Integrated the solution with Istio for service discovery and Splunk for platform observability and tracing.
- Rebuilt a failing identity management platform in AWS that was breaching its C1 SLA by designing and implementing a blue/green deployment strategy with automated failover, resulting in 99.99% uptime over nine months and a one-hour RTO.
 - Reduced platform AWS costs by approximately 30% by optimizing scheduling and sizing.
 - Developed Golang services to maintain compatibility with legacy systems - both service discovery and API translation.
- Migrated a cluster of .NET microservices from a legacy on-prem solution to a cloud native one. Designed and built the CI/CD infrastructure on Github Enterprise with Vault secret management integration. Pipeline run times improved from 5-20 minutes to < 2 minutes for most applications.

Deloitte

Oct. 2015 – Nov. 2018

Senior Consultant | Nov. 2017 - Nov. 2018

Melbourne, Australia

- Developed a central big data warehouse alongside a large development team which facilitated machine learning model development inside a large telecommunications company. The Spark/Hadoop platform ingested 20-100 TB per day with up to 12 months retention for model training and near real-time inference.
 - Refactored internal Java applications into supporting an event driven architecture by pushing logs to Kafka topics in real-time.
 - Developed ETL services in Scala to perform the relevant data processing. These services were automated with Jenkins for the build and execution across environments

Consultant | Nov. 2015 - Nov. 2017

Melbourne, Australia

- Designed and built a data visualization product for Deloitte Access Economics, which generated interactive dashboards estimating the impact of global events on the Australian economy. The product was used to improve client experience when navigating proprietary data.
 - Built Java services to ETL from public and private datasets into a central PostgreSQL database.
 - Co-developed the user interface in Tableau with a UX designer.
 - Built the automation pipelines in Jenkins for automatically refreshing the data at fixed intervals. Also designed the workflows for promoting new features to the production application from staging.

EDUCATION

University of Technology, Sydney

2012

Bachelor of Business - Maj. Economics, Min. Computer Science, Finance

CERTIFICATIONS, SKILLS & INTERESTS

- **Skills:** Writing & documentation, solution design, networking, distributed systems, security, observability.
- **Interests:** Cinema, programming challenges, visual arts, gardening, hiking, games.
- **Certifications:** HashiCorp - Terraform Associate, AWS - Certified Developer.
